SOFTWARE PARTNERSHIP FOR DRONE COMPANIES

Inspection AI + fleet software

Your drones fly. Our software plans the missions and turns photos into defects and work orders.

How it works

1 Plan

FlightOps plans routes and missions, and manages the fleet, pilots and records.

2 Fly

Works with PX4-based aircraft. Every mission can be tested in simulation first.

3 Detect

AI finds and locates defects on railways, highways and other assets.

4 Report

Findings become work orders and reports your customers can act on.

What we have shown so far

- Full PX4 autopilot flights in simulation, including multi-drone missions.
- Railway inspection: 16 of 17 defects found in simulation on an unseen track.
- Sign-in, encryption, media storage and multi-step routes already built.
- Built in Hyderabad, for Indian and international customers.

What we are asking for

A 30-minute call to see if our analytics can run on your aircraft, then one joint pilot with one of your infrastructure customers.

Results shown are from simulation unless stated otherwise.
