VIRTUAL COMMISSIONING FOR PRODUCTION LINES

Test the line before you build it

Run the real PLC program against a simulated line. Find problems on screen, not on the shop floor.

How it works

1 Model

We build a simulated copy of the line from your layout: stations, conveyors, robots.

2 Connect

Your PLC program connects over OPC UA, just as it would on the real line.

3 Test

We run the line for days in minutes: throughput, bottlenecks, faults.

4 Fix

Control errors and layout problems are fixed before installation.

What we have shown so far

- Working simulation engine with OPC UA PLC connection.
- Throughput and bottleneck reports for every run.
- Less time commissioning on site and fewer surprises at handover.

What we are asking for

One pilot on an upcoming cell or line: you share the layout and PLC program, and we show you the results.

Demonstrated on sample lines in simulation.
